Ponteio No. 15

Practice fingering - provisional musical text

M. Camargo Guarnieri

Using this fingering edition

Prepared for a player who comfortably reaches a ninth. Blue digits are suggested editorial fingerings; black digits were already present in the working transcription. 1 = thumb, 5 = little finger. Left-hand chord digits sit beside the notes; right-hand chord digits sit above. Read stacks from bottom to top for ascending pitches.

This is a complete fingering draft, not a verified performance edition. The underlying transcription still has uncertain readings in bars 19-20, 24-35 and 51-53. Check those bars against the photographs before learning them.

Right hand: use 1, then 2-5 for the recurring low-note / upper-pair gesture. Move the hand between positions; do not hold the first note through the upper pair. Use 1-3-5 for the octave chords. On black-key octave chords, bring the whole hand farther into the keyboard rather than reaching with the thumb alone.

Left hand: the bass normally uses 5; upper chord notes use the remaining fingers while the bass is held where feasible. A written long bass does not mean that the hand should stay stretched after it has sounded. The score contains no newly prescribed pedal marks: any pedal-assisted release is an editorial option, and needs listening for harmonic clarity.

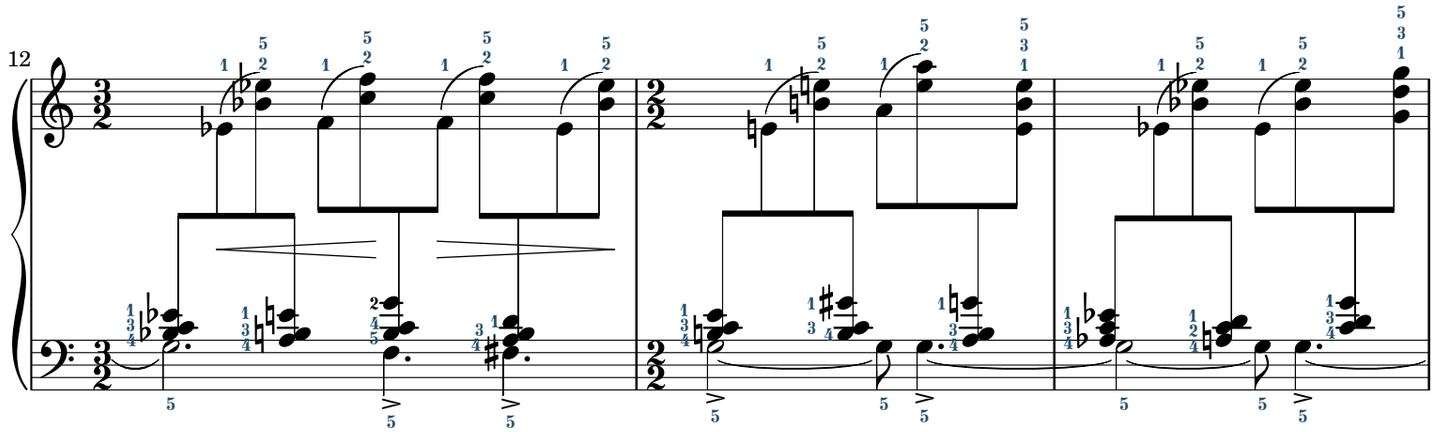

Bars 2 and 37: the printed 2 accompanies the high left-hand note. The proposed 5-4-2 is a wide shape; try 5-4-1 if it feels strained. The bass-to-chord span exceeds a ninth: catch the bass first with pedal, release and relocate to the upper chord. This is a rolled execution, not an instruction to hold all four notes with the hand. Check the source and coordinate the roll with the right hand.

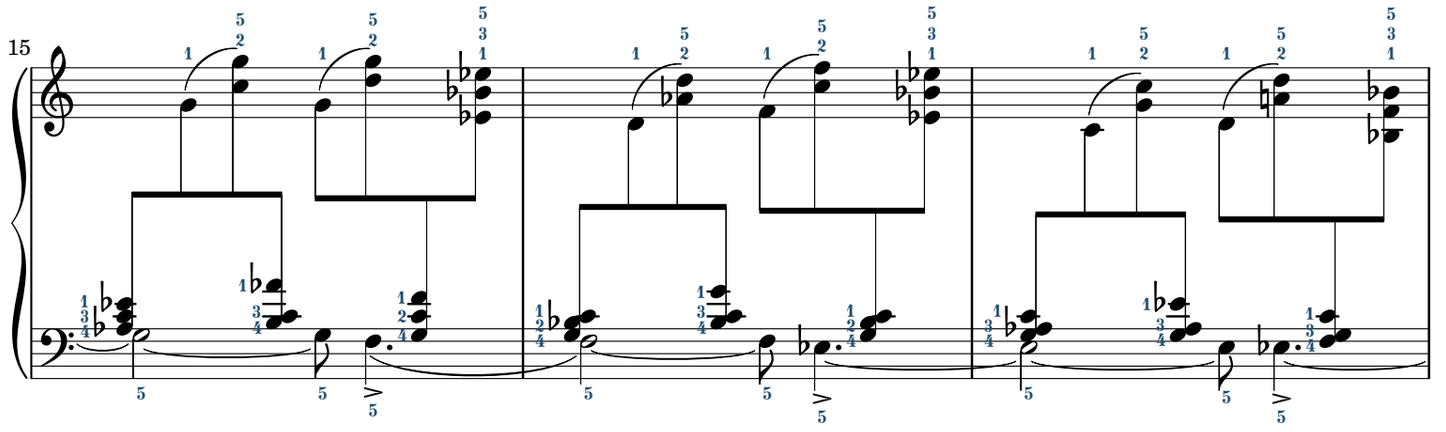

Where an upper left-hand chord uses 5 while a bass is still sounding (especially bars 12, 23-28 and 37), release the bass to pedal before moving; do not assign 5 to two held keys. In bar 30 the inner bass D uses 3. Further wide combinations occur in the closing bars. In particular, bars 51-52 as currently transcribed require rolled, pedal-assisted bass sonorities and an immediate move to the upper part. Do not drill that ending until its pitches are confirmed. The numbers specify the successive hand shapes, not a physically sustainable simultaneous stretch.

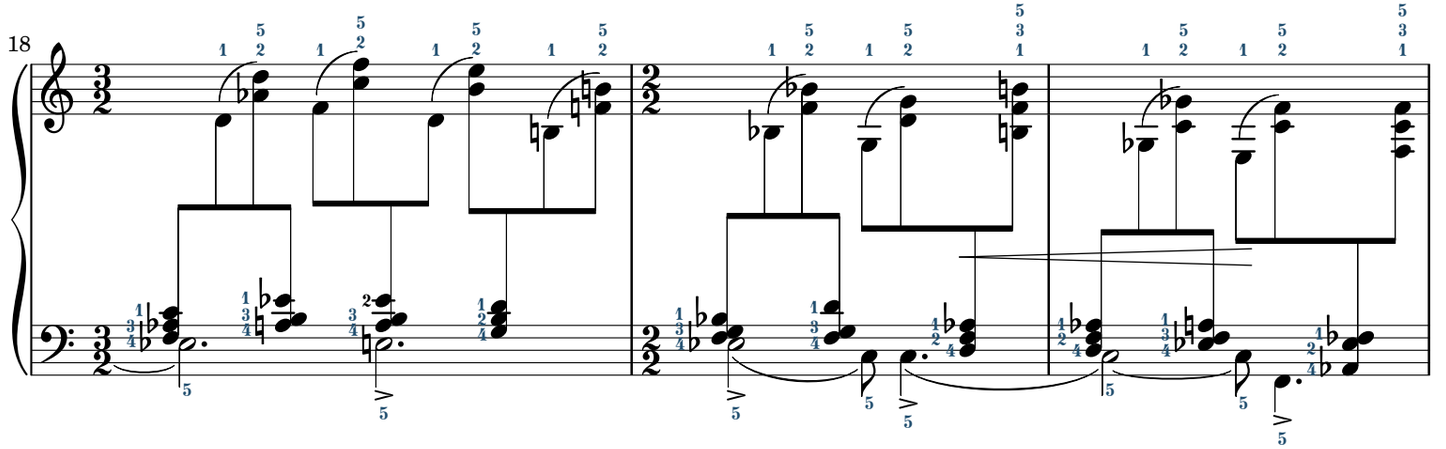

Practise one bar at a time: first the right-hand gestures, then the left-hand bass and chords, then the interlocking attacks slowly. Learn each landing before increasing tempo. Keep the two main pulses in 2/2 even though the hand exchanges form a repeating three-attack pattern. The printed tempo is a long-term target, not a starting speed.

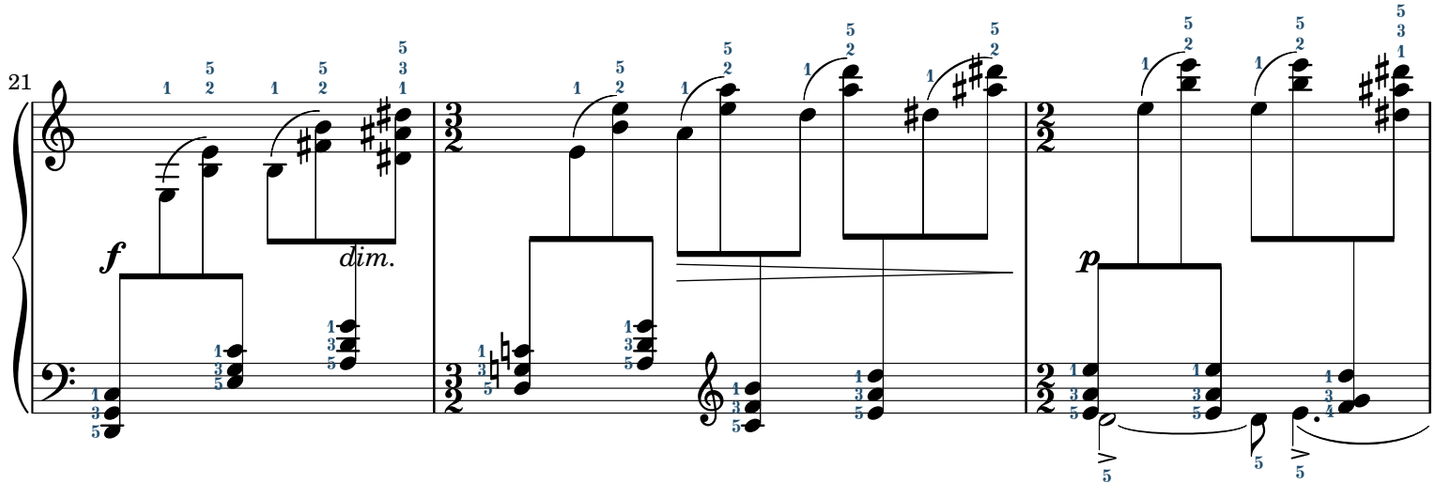

These choices were reviewed on the written score, not tested at a piano. If a position or transition feels awkward, mark the bar and the specific chord so its fingering can be revised. Existing chord-level 2s are interpreted here as belonging to the top note; this attachment remains editorial pending source verification.
